No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Proc. Natl. Acad. Sci. U.S.A. 77:2239-3243(1980).
C. I. MISCELLANEOUS: This mu chain was isolated from the pla
patient with macroglobulinemia.
C. I. SIMILARITY: Contains 1 immunoglobulin-like domain.

This construct is used to determine the ability of H11-scFv antibody fragments to bind specifically to the C-antigen on cancer cells. Such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polynucleotide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for gene therapy. The human monoclonal antibody (WAb), designated H11, specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, mallignant melanoma, breast adenocarcinoma, lung adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and prostate adenocarcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antigen b

The present sequence is human monoclonal antibody (Mab), H11-single che variable region (scFv). The H11 light chain variable region is linked the heavy chain variable region through a (SGGG) linker to form monomers. The invention relates to human monoclonal antibody (Mab) H11-H11-(scFv) single chain variable (V) region fragment and their

H11,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          corresponding DNA molecules. H11 antibody is an immunoglobulin of IgM subclass which is specific to C-antigen found specifically on neoplastic cells and not on normal cells. H11 is an antibody obtained from the fusion of peripheral blood lymphocytes of a 64 year old male with a low grade glioma and fused to a human myeloma cell line to produce a hybridoma designated NBGMI/H11. A pharmaceutical composition comprising H11 and its derivatives are useful in the diagnosis, imaging and treatment of neoplastic disease, particularly, melanoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon carcinoma, gastric carcinoma, prostate carcinoma, lung carcinoma, lung carcinoma, prostate carcinoma, prostate carcinoma, prostate carcinoma, soft tissue sarcoma, small cell lung carcinoma, prostatic adenocarcinoma, B and T cell lymphomas and chronic leukaemias. H11 DNA is also used in vaccines and gene therapy

The invention relates to a polypeptide which is an antigen binding fragment of a monoclonal antibody specific for an antigen detected on neoplastic cells. The antigen binding fragment (ABF) is useful for treating a patient with a neoplasia. The individual has a clinically detectable tumour. The method is useful for palliating the neoplasia. The method reduces the risk of recurrence of a clinically detectable tumour. The antigen binding fragment is labelled with a therapeutic mietry such as radioisotopes or immunomodulators. ABF is useful for detecting Cantigen in a sample. The polypeptide is useful for diagnosing, localising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and/or treating neoplasias, including melanoma, neuroblastoma, glioma, cost tissue sarcoma and small cell lung carcinoma. The polypeptide is useful for manufacturing novel reagents and for treating and imaging brain cancer. ABF is useful as a diagnostic and imaging respent. The composition is useful as a diagnostic and imaging respent. The composition is useful as a diagnostic and imaging reagent. The polynucleotide is useful in expression systems for the production of CC cantigen specific antibody, termed H11 or alphaC, as hybridisation cc probes to assay for the presence of alphaC polynucleotide or related CC sequences in a sample, as primers to effect amplification of desired CC polynucleotides and in pharmaceutical compositions including vaccines and CC polynucleotides and in pharmaceutical composition are useful for genetically caltering cells in vivo, thus treating various types of cancer. The CC polypeptide, polynucleotide and the composition are useful for detecting CC or treating cancer, including therapy of cancer and prophylactic care, CC particularly for decreasing the risk of recurrence. The present sequence CC represents the amino acid sequence of the human C-antigen specific crudely H11 single chain variable region fragment, scfv, #1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ¥,
invention relates to a composition comprising an antigen binding ment of an antibody comprising H chain V region and L chain V region specifically recognises C-antigen. The invention is useful for ting a patient with a neoplasia. The antigen binding fragment of the body is used as diagnostic and imaging reagents. The invention is ultimated the second of the complex control of the control of the control of the complex control of the con

                                                                                                                                                                                                                                                                                             This sequence represents a human H11 monoclonal antibody single chain vegion fragment (H11-scFv) construct which is capable of forming dimers. This construct is used to determine the ability of H11-scFv antibody fragments to bind specifically to the C-antigen on cancer calls. Such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polynucleotide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for gene therapy. The human monoclonal antibody (MAb), designated H11, specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma, macrater adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and

Composition comprising antigen binding fragments of an antibody that recognizes an antigen on neoplastic cells but not on normal cells foin diagnosis, imaging and treatment of carcinomas. use

Disclosure; Col 69-70; 56pp; English

The present sequence is human monoclonal antibody (Mab), H11-single chain CC variable region (scFv). The H11 light chain variable region is linked to the heavy chain variable region through a (SGGG3) linker to form dimers. The invention relates to human monoclonal antibody (Mab) H11, H11-(scFv) single chain variable (V) region fragment and their corresponding DNA completes. H11 antibody is an immunoglobulin of IgM subclass which is specific to C-antigen found specifically on neoplastic cells and not on cormal cells. H11 is an antibody obtained from the fusion of peripheral companions of the fusion of peripheral companions of the fusion of peripheral composition of peripheral composition of a 64 year old male with a low grade glioma and fused to a human myeloma cell line to produce a hybridoma designated NBGM1/H11. A pharmaceutical composition comprising H11 and its derivatives are cuseful in the diagnosis, imaging and treatment of neoplastic disease, particularly, melanoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon carcinoma, pastric carcinoma, prostate carcinoma, small cell lung carcinoma, neuroblastoma, glioma, soft tissue sarcoma, small cell lung carcinoma, prostatic adenocarcinoma, B and T cell lymphomas and composition of prostatic carcinoma, small cell lung carcinoma.

The antigen binding fragment (ABF) is useful for treating a patient with a neoplasia. The individual has a clinically detectable tumour. The method is useful for palliating the neoplasia. The method reduces the risk of recurrence of a clinically detectable tumour. The method is useful for palliating the neoplasia. The method reduces the risk of recurrence of a clinically detectable tumour. The method reduces of a clinically detectable tumour. The method is useful for palliating the neoplasia. The control of a clinically detectable tumour. The palliating control of a clinically detectable tumour. The palliating control of a clinically detectable tumour. The palliating control of antigen in a sample. The polypeptide is useful for diagnosing, localising control of tissue sarcoma and small cell lung carcinoma. The polypeptide is useful for manufacturing novel reagents and for treating and imaging to composition is useful for eliciting an immune response against neoplasia. The polypeptide is useful as a diagnostic and imaging reagent. The composition is useful for eliciting an immune response against neoplasia. The polypucleotide is useful an expression systems for the production of corrects in a sample, as primers to effect amplification of desired composition are assay for the presence of alphaC, as hybridisation of desired golynucleotides and in pharmaceutical compositions including vaccines and composition are useful for detecting control of contr

                                                                                                                                                                                                                                                                                                                                                    The invention relates to a composition comprising an antigen binding fragment of an antibody comprising H chain V region and L chain V region that specifically recognises C-antigen. The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of the antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types of cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFv).

New antibodies which have specific binding affinity for a receptor protein tyrosine kinase (RPTK) and block constitutive activation of useful for treating bone and cartilage disorders, or malignant cell proliferative diseases. of f RPTK,

Example 3; Fig 29B; 122pp; English

cc affinity for a receptor protein tyrosine kinase (RPTK), particularly for ca fibroblast growth factor receptor (FGRR), and which blocks constitutive activation of an RPTK. Also described: (1) pharmaceutical compositions comprising (1) as an active ingredient and a pharmaceutical carrier, ce excipient, or auxiliary agent; (2) a kit comprising (1), at least one carripted; (2) a kit comprising (1), at least one certifications for use; (3) a method for treatment of bone and cartilage crelated disorders by administering a composition of (1) to the RPTK, and certificated particularly a cell proliferative disease or cell disorder by administering a composition of (1) to the subject; (4) a method for treating or inhibiting a cell proliferative disease or cell sorder by administering the antigen-binding portion of an certibody which blocks ligand-dependent activation of RPTK; (6) an certificated nucleic acid molecule encoding a VI-CDR3 DNA region; (7) an isolated nucleic acid molecule encoding a VI-CDR3 DNA region; (8) vectors comprising a nucleic acid molecule of (6) or certificate and cartilage disorders and cartilage disorders and cartilage disorders including skeletal disorders such as composition of comp CC acanthosis nigricans dysplasia) or a craniosymostosis disorder (e.g. CC Muenke coronal craniosymostosis or Crouzon symotrome with acanthosis conjugations or Crouzon symotrome with acanthosis conjugation may also be used for treating or inhibiting conjugation of the composition may also be used for treating or inhibiting conjugation cell proliferative disease or disorder associated with abnormal progression of treating or inhibiting conjugations, colon, cervical, bladder, coloncated with the conjugation of the conjugation of conjugation, primary coloncated conjugation of transitional conjugations, tumour progression (particularly progression of transitional coll carcinoma or mammary carcinoma), or tumour metastasis, where the coll proliferative disorder may be associated with the action of a constitutively activated RPTK, or with ligand-dependent activation of the proproliferative diseases and disorders associated with ligand-compositions may further be used for treating conjugations. The province conditions (e.g. haemangiomas, angiotibromas and psortasis). The present conditions (e.g. haemangiomas, angiotibromas and psortasis). The present conditions control in the exemplification of the present invention. The present invention describes a molecule (I) conbinding portion of an isolated antibody which has comprising the antigen has specific binding

A The present invention describes an antibody molecule (I) capable of CC specifically recognising two regions of the beta-A4 peptide/Abeta4. The CC ser-Gly-Tyr ADA93886 or its fragment, and the second region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-CC gly ADA93887 or its fragment, and the second region comprises the encoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I) comprising (I) comprising the lost cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I); (8) testing the resulting Fab optimised clones; (1) expansing (I); (8) testing the resulting Fab optimised clones; (1) expressing (I) of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8); (7) optimising (I) composition, comprising optimisation of (I), and formulating the resulting Fab optimised clones; (10) expressing (I) composition, comprising optimised clones; (11) preparing a pharmaceutical the optimised antibody/antibody molecule with a carrier; and (12) a composition prepared by method (8). (I) has neuroprotective, nootropic and antiparkinsonian activities, and can be recovered to the season and/or treatment of a disease associated with a carrier; and (12) a muralso be used in preparing a diagnostic composition for the disease mentioned above. The antibody is used for the detection of the disease mentioned above. The antibody is used for the
